Grid Banner Export – How to use

ONE WIDE IMAGE → 3 SEAMLESS PROFILE POSTS

How it works

Posts are uploaded as 4:5 (1080 × 1350), but the profile grid only shows the centre 3:4. The script cuts three overlapping posts from a 3105 × 1350 area – they join seamlessly in your grid, and each post still looks complete when opened.

Install once

In the unzipped folder run **bash install.sh** in Terminal (asks for your Mac password) – or copy the file directly to:

```
/Applications/Adobe Photoshop 2026/Presets/Scripts/
```

Then quit Photoshop with ⌘**Q** and start it again. Menu: **File → Scripts → Grid Banner Export**.

Create your banner

1. Open a wide image in Photoshop (16x5 or 20x5 work great).
2. Optional: choose the framing with the Crop tool, ratio **3105 × 1350** (≈ 2.3 : 1). Without cropping the centre is used.
3. **File → Scripts → Grid Banner Export** and pick an output folder.
4. Post in this order: **post-1_right → post-2_middle → post-3_left** (the newest post appears top left).
5. **Pin** all three posts – the banner then stays at the top of your profile.

Tips

- Keep the main subject in the middle – 16x5 images lose a bit on the left and right.
- Short captions are enough, e.g. “Banner 1/3 ✈”, “Banner 2/3 ✈”, “Banner 3/3 ✈”.
- Menu entry missing? Quit Photoshop with ⌘Q? File directly in Presets/Scripts (not in a subfolder)?
- Based on Instagram’s current 3:4 profile grid.
